
CROSSPOINT ROTTWEILERS — HOW TO EDIT YOUR WEBSITE YOURSELF

Your site is made of "page files" that end in .html (one per page), plus an "images" folder that holds every picture. To change wording or swap a photo, you open the right page file, make the change, and save.

You do NOT need to know how to code. You're just typing over words and swapping picture names. Follow the rules below and you can't break it.

WHAT YOU'LL USE

- To edit pages: open the .html file in VS Code (you already have it) or in Notepad. In VS Code: right-click the file > "Open With Code". In Notepad: right-click the file > Open With > Notepad.
- To find your photos: the "images" folder inside your website folder.

Your website folder:

Desktop\Crosspoint New Website Build 2026\website\

WHICH FILE IS WHICH PAGE

index.html		Home page
dogs.html		Our Dogs (the grid of all dogs)
puppies.html		Available Puppies (for-sale listings + prices)
litters.html		Litters
about.html		Our Program
contact.html		Contact
adidas.html		Adidas profile
mila.html		Mila profile
argo.html		Argo profile
rumpi.html		Rumpi profile
dog-profile.html		Hercules profile

HOW TO CHANGE TEXT (the easy part)

1. Open the page file (e.g. index.html).
2. Press Ctrl+F to search. Type a few words of the text you want to change (e.g. "Eight weeks young"). It jumps right to it.
3. The text sits BETWEEN little tags that look like <h3> ... </h3> or <p> ... </p>. Only change the words IN BETWEEN. Example:

<p>Eight weeks young — future stud.</p>

Change ONLY the middle part:

<p>Now twelve weeks old — future stud.</p>

4. Do NOT touch the <p>, </p>, <h3>, or anything inside < >. Those are the "frame." If you delete a < or >, that section can break.

5. Save with Ctrl+S.
6. Open the page in your browser to check it (double-click the .html file), then press Ctrl+Shift+R to force it to show your change.

HOW TO SWAP A PICTURE (the important rule: RENAME it)

Your computer "remembers" old photos hard (cache). The reliable way to swap a photo is to give the NEW photo a NEW NAME, then point the page at the new name. Don't just overwrite the old file with the same name – the browser often keeps showing the old one.

STEP 1 – Put the new photo in the images folder.

Most dog photos live in: images\dogs\
Give it a clear NEW name, e.g. adidas-card-2.png

(Keep the same shape/size as the one you're replacing – see sizes at the bottom – or it may look stretched or cropped.)

STEP 2 – Tell the page to use the new name.

Open the page file, press Ctrl+F, and search for the OLD photo name (e.g. adidas-card.png). You'll find something like:

```

```

Change ONLY the file name to your new one:

```

```

(Leave the rest – the "images/dogs/" part and the alt text – alone.)

STEP 3 – Save (Ctrl+S), open the page, and Ctrl+Shift+R to refresh.

Next time you swap that same photo, use -3, then -4, etc. The point is just: always a brand-new name.

GOLDEN RULES (so you never break anything)

- ALWAYS make a backup copy of a page file before editing it the first few times. Right-click > Copy, then Paste, and you'll get a copy you can fall back to. (You can also delete these copies later.)
- Only change words and picture NAMES. Never delete anything inside < >.
- One change at a time. Save and check it before doing the next.
- If something looks broken: undo with Ctrl+Z (you can press it many times), or restore your backup copy.
- Photos: new name every time. Then Ctrl+Shift+R in the browser.

PHOTO SIZES (so swaps look right, not stretched/cropped)

- Dog "cards" on Home and Our Dogs pages: 880 x 1100 (tall portrait)
- Dog profile hero (big photo at top of a dog's page):
1400 x 1120 (wide landscape,

leave room above the head AND
below the feet)

- Puppy photos: same idea as cards, keep them consistent.

Canva is the easiest place to crop to an exact size: start a custom-size design with the numbers above, drop your photo in, then download as PNG.

PRICES / AVAILABLE PUPPIES

Edit puppies.html the same way (text + photos). When a puppy sells, you update its text/status there. The "Buy" buttons use Stripe payment links (handled separately) – leave those button settings alone unless you're pasting in a new Stripe link.

That's it. Text = type over the words. Photos = new name + point to it + hard refresh. When in doubt, make a backup copy first.
